

The ALICE TRD Global Tracking Unit - Cosmic Trigger -

23.06.2008
Felix Rettig

Cosmic Trigger Setup

Pre-Trigger based on TOF, L1 contribution based on GTU Cosmic Trigger

Cosmic Trigger – Purpose

Purpose:

Final GTU tracking/trigger algorithm is not yet ready to use

→ a simple trigger using tracklet-based heuristics

Chamber granularity
charge deposited, number of hits, no
positional/directional information usable

Advantages:

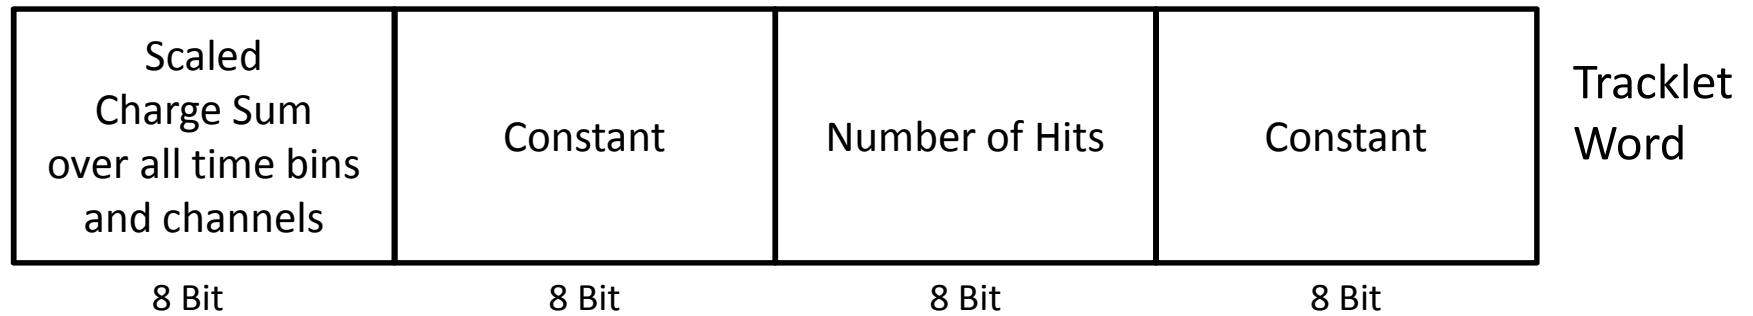

Deliberately unspecific, broad selection of “non-empty” events

→ much less bias than final algorithm will provide,
because of geometrical limitations in tracking

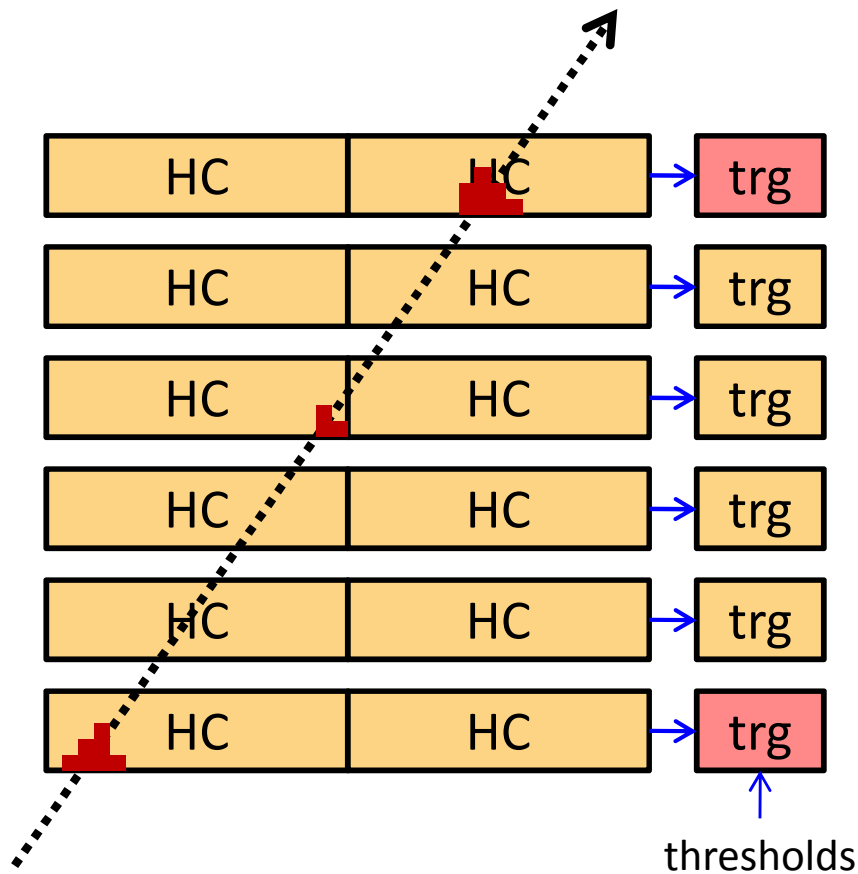

Cosmic Trigger – MCM Level

Modified tracklets for cosmic trigger: no tracklet parameters, instead...

Cosmic Trigger – Chamber Level (TMU)

Summation of tracklet numbers, charge and hit numbers over all tracklets from both half-chamber links of each chamber.

Threshold conditions for trigger:

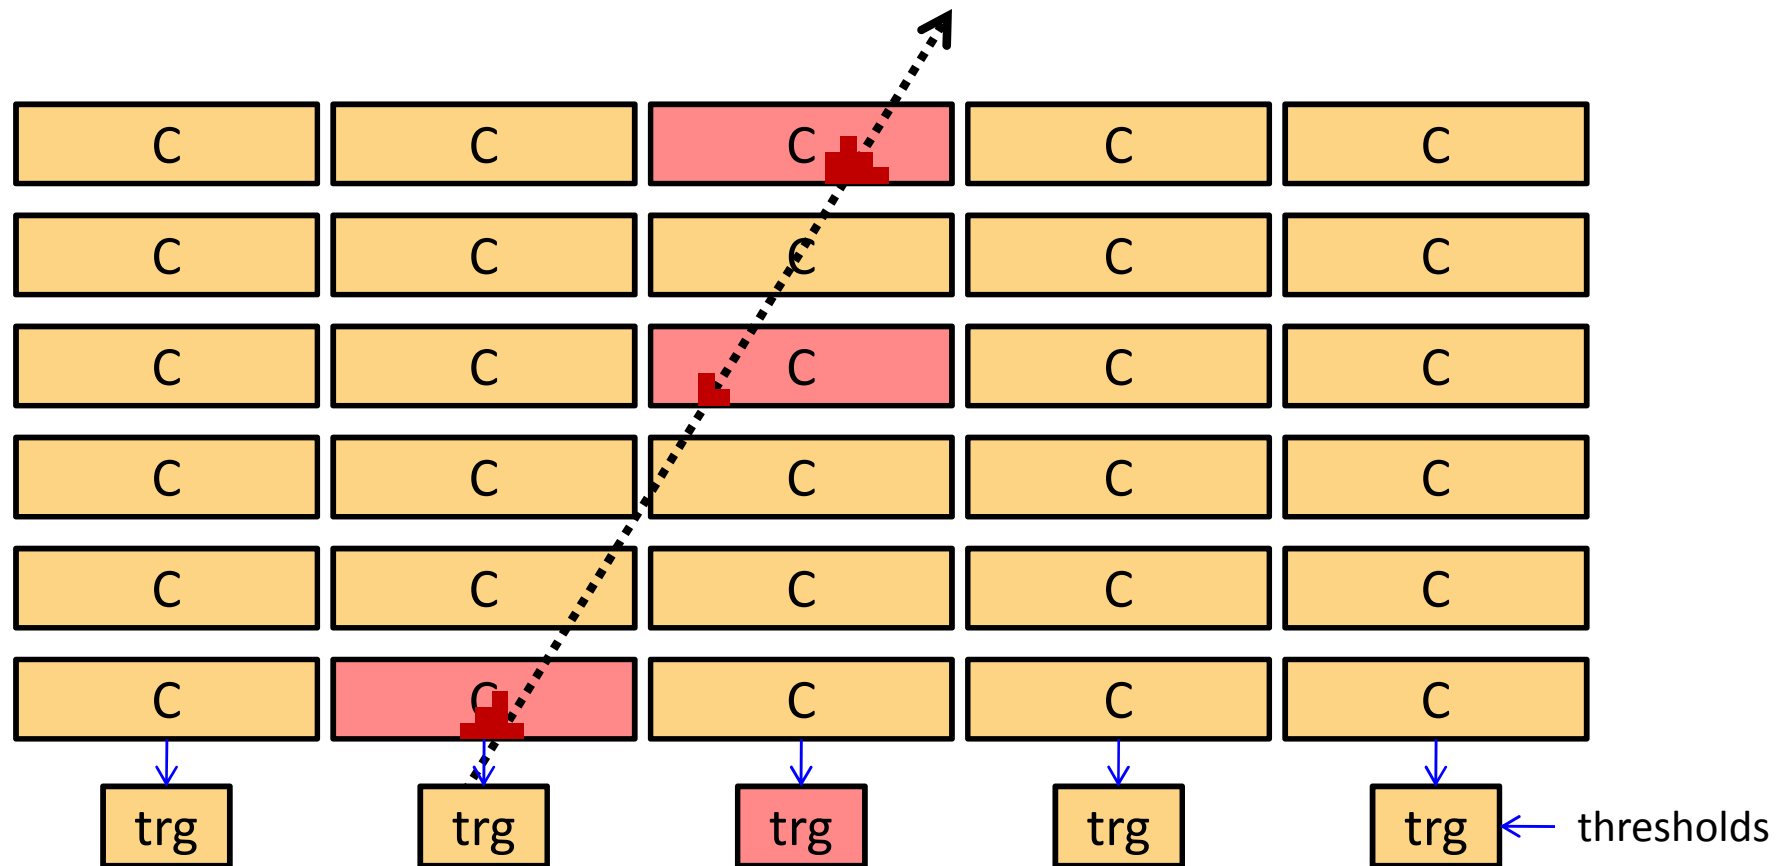

- Number of Tracklets per chamber
- Charge summed up over all tracklets per chamber
- Hits summed up over all tracklets per chamber

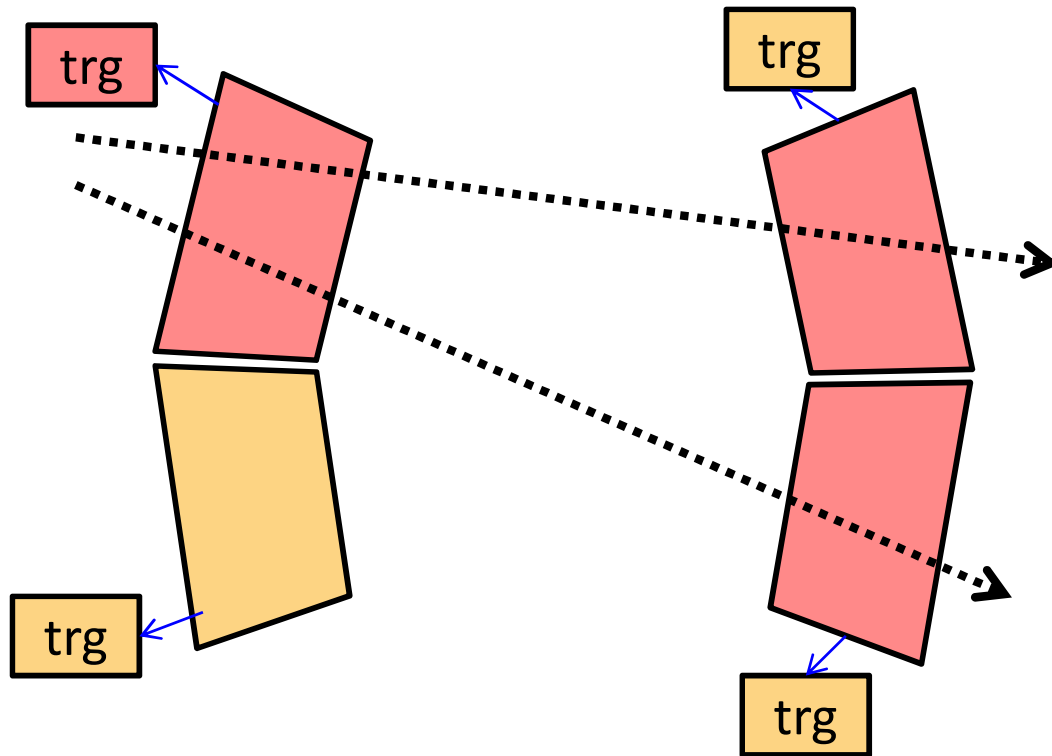

Cosmic Trigger – Stack Level (SMU)

Trigger condition: number of “active” chambers per stack

Optionally: minimum/maximum limit for number of stacks hit

Cosmic Trigger – Supermodule Level (TGU)

Trigger conditions:

- single supermodule
- one-to-many correlations between supermodules

Optionally:

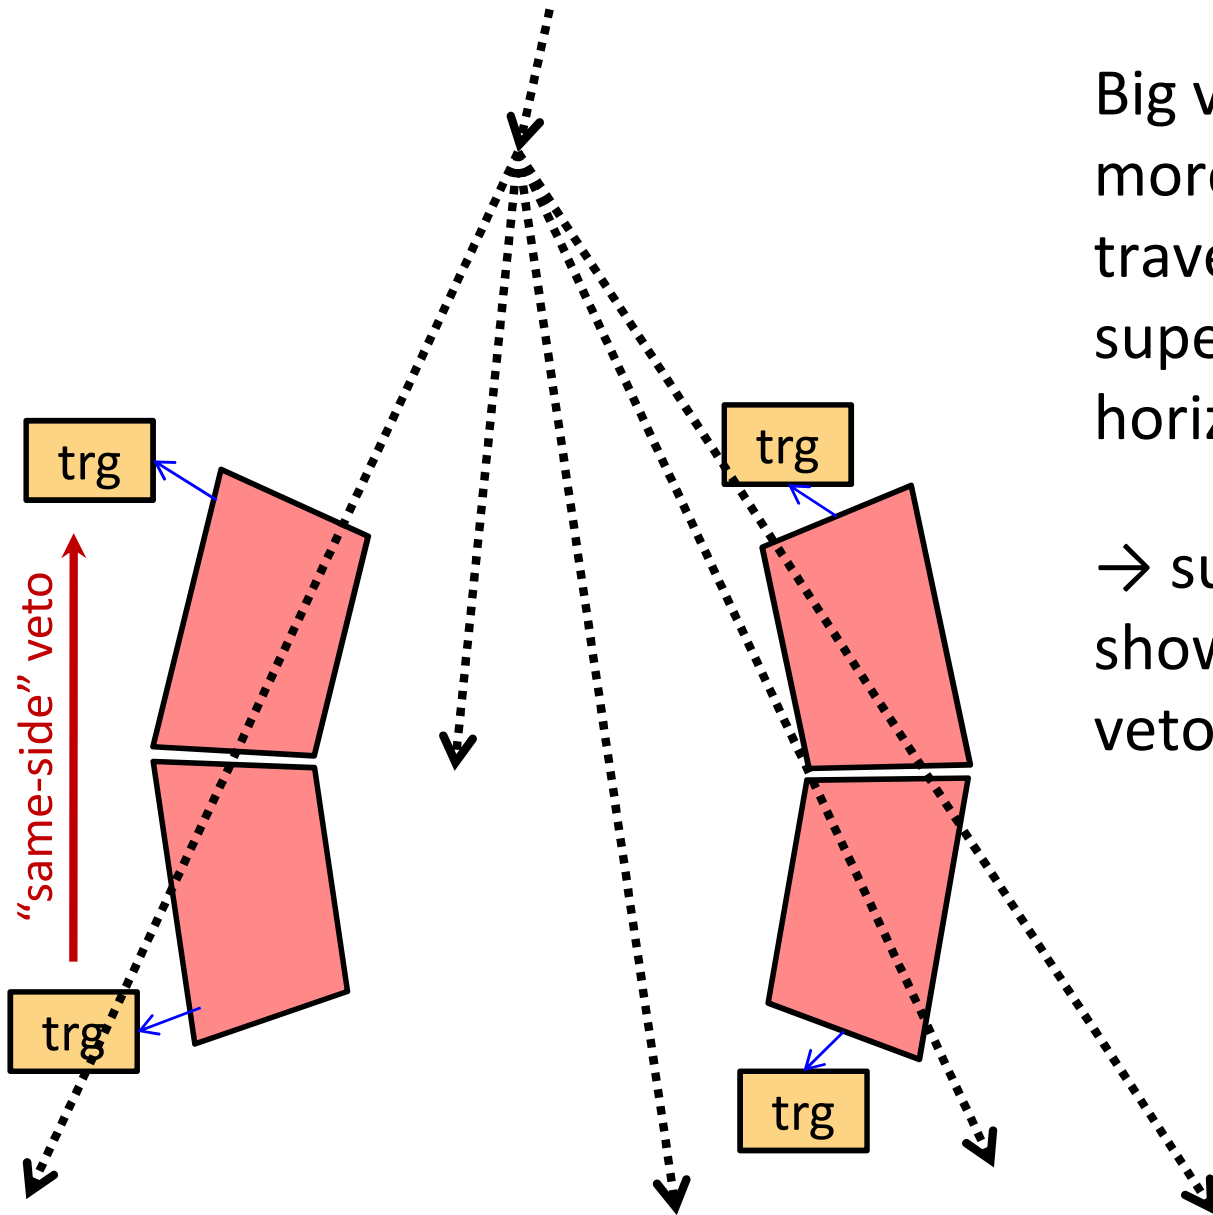

- “same-side veto” in one-to-many correlation

Events like shown above may be very rare → experience, rates?

Such events rejected by TOF-/ACORDE-coincidence settings?

Cosmic Trigger – TGU Level II

Big vertical showers are more likely than one track traversing two supermodules nearly horizontally

→ suppression of vertical showers by “same-side veto” possible?

Cosmic Trigger – Parameter Tuning, Data taking

- Huge configuration space (thresholds and masks)
 - How do typical events (single tracks, showers, ...) look like in terms of the modified tracklets?
 - Tuning of GTU cosmics trigger configuration to properly select interesting events
- Joint effort: one or two days data taking/trigger tuning at CERN
 - TRD operator
 - GTU operator
 - Offline analysis support for immediate reconstruction and characterization of recorded events
 - assessment and tuning of cosmics trigger configuration
 - properly working Pre-Trigger-Box
- Selection of a few trigger configurations for subsequent use

Cosmic Trigger – Remarks

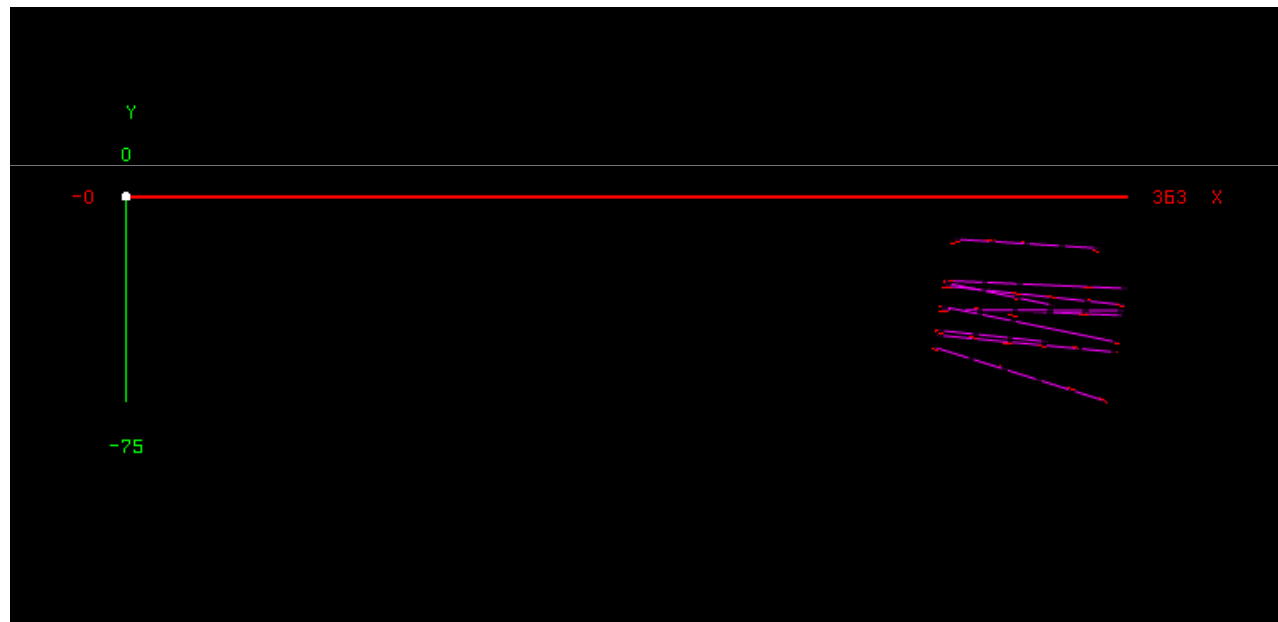

- New Supermodule Configuration / TRAP operation mode
 - Incorporation into databases and transfer to wingDB at CERN
- Modified tracklets and tracklet numbers
 - Zero suppression efficiency is different to case with “normal” tracklets
 - Modified tracklets cannot be used later on for offline simulation of GTU tracking and trigger operation
- HLT as additional trigger level could provide further selection

Cosmic Trigger – Typical Events

Which kind of events is to be selected by the trigger?

Most events reconstructed by now look similar to these:

ev4 – ACORDE, 10 tracks

• Thanks to A. Bercuci

Cosmic Trigger – Typical Events

Ev2 – ACORDE, 5 tracks

Cosmic Trigger – Typical Events

ev6 – ACORDE, 10 tracks

Thank You for Your Attention
